SEO AUDIT · OCTOBER 28, 2026

SEO Audit for travelbusinessclass.com

TravelBusinessClass is an established US business-class fare consolidator (Travel Management Group LLC, Sunny Isles Beach, FL; domain registered June 2019) with a 429-URL Nuxt site, a 4.9 Trustpilot score from 5,230 reviews, and an estimated 183K visits per month. The traffic is real, but it is bought: Paid Search is the #1 channel and organic search does not make the top three. The reason is largely self-inflicted — the production site config still points at a `v2.` staging host, so `robots.txt` and every one of the 429 sitemap URLs send Google to the wrong domain, while 159 "first class" pages duplicate the "business class" pages almost sentence for sentence. This audit separates the solid commercial base from the technical and content debt that is holding organic back.

🔍 429 sitemap URLs crawled (428 live, 1 × 404)

🔴 100% of sitemap URLs point at v2.travelbusinessclass.com

CROWDO | travelbusinessclass.com

CURRENT STATE

Summary of your website performance

A 7-year-old domain (registered June 16, 2019, GoDaddy; hosted on DigitalOcean) running a server-rendered Nuxt frontend with 34 top-level landing pages, 22 airline pages, 163 "best deals" destination pages, 159 "first class" destination pages, 67 blog posts and 3 legal pages. Security headers are strong (HSTS, CSP, COOP/CORP, Permissions-Policy), HTTP and `www` both 308-redirect cleanly to the apex, and an owner-authored `llms.txt` is in place. Similarweb estimates 183.4K visits in September 2026 (+29.6% month-on-month, global rank #176,002, #207 in US Air Travel), but with **Paid Search as the top channel (36% of desktop visits)**, Display second and Direct third — organic search is not among

the top three. Meanwhile the one file that tells Google what to index, `sitemap.xml`, lists 429 URLs on `v2.travelbusinessclass.com`, a host that serves an untrusted TLS certificate.

183K	36%	429	159
Est. visits / mo (Similarweb, Sep 2026)	Paid Search share — #1 channel; organic not in top 3	Sitemap URLs pointing at the wrong host (100%)	Near-duplicate "first class" pages (37% of site)

Methodology: Technical and on-page findings come from a full HTTP crawl of all 429 URLs in `sitemap.xml` on October 28, 2026, fetched on the production host (`travelbusinessclass.com`) with the raw HTML parsed for titles, descriptions, canonicals, headings, structured data, image alt text and page weight, plus header, redirect, `robots.txt`, DNS and TLS checks. Traffic, rank and channel figures are Similarweb public estimates (September 2026) — directional, not analytics. Reputation findings come from the live Trustpilot, BBB, Tripadvisor and Bogleheads pages. Domain data is from Verisign RDAP. **Ahrefs and Google Search Console are not connected for travelbusinessclass.com** — no Domain Rating, backlink, ranked-keyword, click, impression or coverage figures appear anywhere in this report, and indexation status is inferred from the sitemap/robots configuration, not verified per URL. PageSpeed Insights quota was exhausted at crawl time, so page-weight figures are measured HTML/CSS/JS byte sizes, not Lighthouse scores.

This audit focuses on three things:

- Fix the one-line configuration error that points `robots.txt` and all 429 sitemap entries at `v2.travelbusinessclass.com` — the single highest-leverage change available, and the reason organic discovery is running on Google's goodwill rather than on the site's own signals
- Collapse the duplication: 159 "first class" destination pages that mirror the "business class" pages, 84 pages with no canonical tag at all, 26 pages sharing a single title, and two copies of the Terms & Conditions
- Reduce dependence on paid acquisition by making the 67-post blog and 22 airline pages carry their weight — right now they are published without canonicals, structured data or current-year metadata, and four of them weigh 2–10 MB each

STRATEGY OVERVIEW

Here's our step-by-step roadmap

Four phases in priority order. Phase 1 is a configuration fix that takes an afternoon; everything after it is content and template work that compounds over the following quarter.

1

Indexation Signals

Point robots.txt + sitemap at the production host; connect GSC

2

De-duplication

Canonicals, first-class vs best-deals, shared titles

3

Template & Weight

Titles, H1s, schema, 10 MB blog posts, inline CSS

4

Organic Growth

Blog as acquisition channel, review-site parity, editorial links

PHASE 1 — NOW

1. Set the Nuxt site URL (the `site-config` `url` value, currently `https://v2.travelbusinessclass.com/`) to `https://travelbusinessclass.com` in production — this alone rewrites `robots.txt` and all 429 sitemap entries
2. Decide what `v2.travelbusinessclass.com` is for: either 301 it to the apex or block it (`noindex` + robots disallow) and fix its certificate — right now it resolves (157.230.201.57) but fails TLS validation
3. Verify `travelbusinessclass.com` in Google Search Console, submit the corrected sitemap, and remove `/special-offers` (404) from it

PHASE 2 — WEEKS 1–2

1. Add self-referencing canonicals to the 84 pages that have none — homepage, all 67 blog posts, `/about`, `/contact-us`, `/blog`, legal pages and 7 deal landing pages
2. Resolve the 159 `/first-class/*` pages: either rewrite them with genuinely first-class content and pricing, or canonicalize them to the matching `/best-deals/*` page
3. Give the 26 pages currently titled "Cheap Business Class Tickets | Travel Business Class | Business Class" unique titles; canonicalize `/page/terms_and_conditions_2025` and `/corp-clients` (shares the homepage title)

PHASE 3–4 — WEEK 3+

1. Move base64-inlined images in the 4 blog posts weighing 2–10 MB to the CDN; cut the ~331 KB of inline CSS shipped on every page; serve WebP/AVIF (0 of 5,700 images today)
2. Shorten the 319 titles over 60 characters, remove stale "2022/2023" from 41 meta descriptions, add an H1 to the homepage, add `TravelAgency` / `Organization`, `BreadcrumbList` and `Article` JSON-LD (only 1 of 428 pages has any)
3. Turn the blog into an acquisition asset (currently 67 posts, no canonicals, no schema) and earn editorial mentions in travel press — the USA Today feature already referenced on the blog shows the brand qualifies

PRIORITY ISSUE #1 · INDEXATION SIGNALS

robots.txt and all 429 sitemap URLs point at a staging host

The production homepage's server-rendered Nuxt payload sets the site URL to `https://v2.travelbusinessclass.com/` (environment: `production`, app: `tbc-client-site-frontend`). `@nuxtjs/robots` and the sitemap module both read that value, so `robots.txt` declares `Sitemap: https://v2.travelbusinessclass.com/sitemap.xml` and **every `<loc>` in the sitemap — 429 of 429 — uses the `v2.` hostname.** That host resolves to a DigitalOcean IP but fails TLS validation (`SEC_E_UNTRUSTED_ROOT`), so a crawler following the sitemap hits a certificate error before it sees a single page.

WHAT THE LIVE FILES SAY — FETCHED OCTOBER 28, 2026

CHECK	OBSERVED	EXPECTED	STATUS
`robots.txt` → Sitemap directive	`https://v2.travelbusinessclass.com/sitemap.xml`	`https://travelbusinessclass.com/sitemap.xml`	Wrong host
`sitemap.xml` → `<loc>` hostnames	`v2.travelbusinessclass.com` × 429	`travelbusinessclass.com` × 429	Wrong host
Nuxt `site-config.url` (SSR payload)	`https://v2.travelbusinessclass.com/`	`https://travelbusinessclass.com`	Root cause
TLS on `v2.travelbusinessclass.com`	Untrusted root (handshake fails)	Valid cert, or host not public	Broken
Sitemap entries returning 404	1 — /special-offers	0	Stale
`og:url`, canonicals (where present)	travelbusinessclass.com	travelbusinessclass.com	Correct
http:// and www. → apex	308 → https://travelbusinessclass.com	301/308 to apex	Correct
`X-Robots-Tag` header	index, follow, max-image-preview:large	index, follow	Correct

WHY THIS MATTERS — AND WHAT IT DOES NOT MEAN

THE PAGES THEMSELVES ARE FINE

All 428 live URLs return **200 on the production host**, are `index,follow`, and where canonicals exist they correctly self-reference `travelbusinessclass.com`. Google can still discover pages through internal links and the strong paid/direct traffic footprint — which is probably why the site ranks at all. The sitemap is simply contributing nothing.

WE CANNOT SEE THE DAMAGE DIRECTLY

Without Google Search Console we can't read Index Coverage, the Sitemaps report, or whether Google has flagged `v2.` as an alternate. What we *can* say: 84 pages have no canonical at all, and for all 429 the sitemap asserts a different host than the one the pages are served from, so Google is left to pick the canonical host on its own. Connecting GSC is the first thing to do after the fix.

ONE-LINE FIX, LARGE BLAST RADIUS

Because robots, sitemap and the SSR payload all derive from the same Nuxt site-config value, correcting the production `NUXT_PUBLIC_SITE_URL` (or equivalent) fixes all three at once. The redeploy is low risk; the follow-up is deciding whether `v2.` should redirect, be blocked, or go dark.

Related but separate: the site is leaning on paid acquisition. Similarweb's channel split shows Paid Search as the #1 source of desktop visits (36.3%), Display second and Direct third — organic search is not in the top three. Similarweb also describes the audience's interests as "AI chatbots and tools, social network, Google apps, productivity, shortcuts" rather than travel — consistent with broad display buying. We are not claiming the sitemap issue caused the channel mix; we are noting that the organic channel has been left without its most basic signals while the paid channel carries the business.

This is a configuration problem, not a content problem — nothing here needs new pages or new links. Fix the site URL, redeploy, confirm `robots.txt` and the first 10 sitemap entries now read `travelbusinessclass.com`, then resubmit in Search Console. Expect Google to re-crawl the sitemap within days; expect coverage data, not rankings, to move first.

TECHNICAL INFRASTRUCTURE

Technical issues

Security posture is better than most travel sites (HSTS with `includeSubDomains`, CSP, COOP, CORP, Permissions-Policy, `nosniff`); redirects are clean; content is server-rendered so nothing depends on JavaScript to be indexed. The debt is in duplication and page weight — the Nuxt build ships ~331 KB of inline CSS and a 438 KB JS bundle on every page, and several blog posts embed their images as base64.

- **159 "first class" destination pages are near-duplicates of the "business class" pages** — HIGH

  Every `/best-deals/{city|country|region}/*` page has a twin at `/first-class/{city|country|region}/*`. Comparing `/first-class/city/london` with `/best-deals/city/london`: **31 of 34 body sentences are identical** — only the words "first class" and the H1 change. Both carry self-canonicals, so Google sees 159 pairs of competing URLs. Either give the first-class set distinct content and fares, or canonicalize each to its business-class twin. Note `/first-class/region/oceania` is in the sitemap and live, but `/special-offers` 404s.

- **84 pages have no canonical tag** — MEDIUM

  The homepage, all 67 `/blog/post/*` articles, `/blog` and its 2 category pages, `/about`, `/contact-us`, `/corp-clients`, the 3 `/page/*` legal pages and 7 deal landing pages (`/best-deal`, `/best-deals`, `/discounted-business-class-deals`, `/first-class-flights`, `/insider-deals`, `/top-airlines-promo`, `/business-class/airlines`). Combined with the sitemap's conflicting host, these are the pages most exposed to Google choosing a canonical you didn't intend. Airline and destination templates already emit canonicals correctly — the fix is extending the same head logic to the remaining layouts.

- **Four blog posts weigh 2–10 MB because images are embedded as base64** — MEDIUM

  `/blog/post/the-most-popular-open-countries-for-travel` is **10.2 MB of HTML** — 31 `data:image/…;base64` URIs totalling 10.3 MB. `…excellent-news-for-world-travellers-in-2022` is 5.3 MB, `…top-10-best-airport-lounges` 4.4 MB, `…travel-smart-in-the-covid-19-pandemic` 2.2 MB. These bypass the CDN and lazy-loading entirely and will fail Core Web Vitals on mobile. Move the images to `cdn.travelbusinessclass.com` and reference them normally.

- **~470 KB average HTML per page, of which ~331 KB is inline CSS** — MEDIUM

  Nuxt is inlining the full stylesheet into every response instead of linking a cached CSS file. The main JS bundle (`_nuxt/82aht_fS.js`) is a further 438 KB uncompressed (correctly cached for 1 year). None of the 5,700 `<img>` tags found across the crawl serve WebP or AVIF. Not an indexation blocker, but it makes every page heavier than it needs to be and caps Core Web Vitals headroom.

- **Duplicate legal and landing URLs** LOW

  `/page/terms_and_conditions` and `/page/terms_and_conditions_2025` share a title and both lack canonicals; `/best-deal` and `/best-deals` both exist; `/best-deals/city/singapore` and `/best-deals/country/singapore` share a title (same for the first-class pair). Minor on its own — but each pair is another place Google has to guess.

- **3 cross-origin links missing `rel="noopener"`; `X-Frame-Options` absent** LOW

  Three `target="_blank"` links on the homepage lack the safety attribute. `X-Frame-Options` is not set, though COOP is — add `frame-ancestors` to the existing CSP to close it. Routine hardening.

> The hosting and security base is genuinely good and nothing here blocks crawling. Do the first-class/best-deals decision and the 84 canonicals in the same sprint as the sitemap fix — together they define, for the first time, exactly which ~270 URLs you want Google to rank.

ON-PAGE SEO

Titles, headings, and structured data

All 428 live pages have a title and a meta description; none is `noindex`. The problems are consistency and age: titles are templated past 60 characters on 3 of 4 pages, 41 descriptions still promise deals "in 2022" or "2023", the homepage has no H1, and structured data exists on exactly one page.

- **319 of 428 titles exceed 60 characters; 26 pages share a single title** — MEDIUM

  The destination and airline templates produce titles like **"Cheap Business Class Flights to All Nippon Airways (ANA) | Travel Business Class"** (80 chars) — and note the template reads "flights **to** [airline]", which is a grammatical artefact of reusing the destination pattern. 26 deal and first-class landing pages all carry **"Cheap Business Class Tickets | Travel Business Class | Business Class"**; `/corp-clients` duplicates the homepage title; `/business-class/airlines` is titled for Delta while its H1 says "Cheapest business class airlines". 52 titles use ✈ / ☎ symbols. Fix pattern: **"ANA Business Class Deals — Save up to 60% | TravelBusinessClass" (≤60 chars)**

- **41 meta descriptions reference 2022 or 2023; 186 pages share 38 descriptions; 59 exceed 160 characters** — MEDIUM

  29 blog posts carry the identical **"Visit travelbusinessclass.com blog to find cheap business class flights for your trip in 2023!"**; 45 first-class pages share one boilerplate description; `/best-deals/region/europe` advertises "airfare 2023"; `/first-class/region/europe` says "save up to 15-60% of travel costs in 2022". Stale years in snippets measurably hurt click-through for a deals business whose whole pitch is currency.

- **Homepage and blog index have no H1; 13 pages have two or three** — MEDIUM

  The homepage renders 25 H2s ("Save with Travel Business Class!", "Methodology", "Passion for excellence!"…) and no H1. `/blog` and both category pages also lack one. Five airline pages (Delta, Emirates, Lufthansa, Turkish, United) and seven city pages (Athens, Düsseldorf, Frankfurt, Munich, Reykjavik, Zagreb, Zurich) have two H1s each; one blog post has three. Separately, the destination H1 is split across two `<span>`s with no whitespace between them, so the DOM text reads **"Business class flights toLondon"** on 26 pages — visually fine, semantically sloppy.

- **Structured data on 1 of 428 pages** — MEDIUM

  The homepage has a well-formed `FAQPage` with 7 Q&As — and that is the entire JSON-LD footprint. No `Organization` / `TravelAgency` (despite a real legal entity, address, phone and BBB accreditation), no `BreadcrumbList` on 322 destination pages, no `Article` on 67 blog posts, no `Offer` markup on the fare cards that are the site's core proposition. For a brand whose SERP is shared with "is it legit?" threads, entity markup is also a trust signal.

579 images without `alt` across 77 pages

LOW

Mostly fare-card and airline-logo images in the destination templates (12 on the homepage alone). Routine template fix; also an accessibility item.

What's already right

LOW

Complete Open Graph and Twitter Card tags sitewide, correct `og:url` on the apex, `index,follow` everywhere, an owner-authored `llms.txt` that names the legal entity and canonical domain, a clean `robots.txt` policy (apart from the host), and server-rendered content throughout. No action needed — noted as a positive baseline.

COMPETITIVE ANALYSIS

Competitive position & link building

SkyLux Travel, Business Class Consolidator and Business Class Guru are the three US business-class consolidators that appear alongside travelbusinessclass.com in live searches for "cheap business class flights consolidator" and in Similarweb's own "similar sites" lists for the domain. All figures are Similarweb public estimates for September 2026.

WEBSITE	ROLE	VISITS / MO	GLOBAL RANK	US AIR TRAVEL RANK	TOP CHANNEL (DESKTOP)	REVIEWS
skyluxtravel.com	Direct — consolidator, phone-first	607K	#78,055	#130	Direct 28%	4.8 · 29,239
businessclassconsolidator.com	Direct — consolidator (WordPress)	11.8K	#1,935,685	#1,414	Organic 37%	4.7 · 1,405
businessclassguru.com	Direct — consolidator	8.5K	#2,542,423	#1,640	Organic 41%	4.8 · 24,523*
travelbusinessclass.com (you)	Audited domain	183.4K	#176,002	#207	Paid Search 36%	4.9 · 5,230

Read the channel column, not just the visits column. travelbusinessclass.com has 15–20× the traffic of the two smaller consolidators, but theirs is majority-organic and yours is majority-paid — Similarweb puts Paid Search first, Display second, Direct third, with organic search outside the top three. Both smaller sites also lost 25–29% of traffic month-on-month, so their organic base is fragile too. SkyLux is the only competitor combining scale (607K) with an owned channel (Direct 28%, Mail third) and an engaged audience (6:02 average visit vs your 1:24). *Business Class Guru's review count is self-reported on its own site; the others are Trustpilot. No Domain Rating or referring-domain figures appear here because Ahrefs is not connected — the comparison is traffic-shape, not link-authority.

SkyLux is the realistic model, not the smaller consolidators. It shows what the category supports once a brand owns its audience: three times your visits, mostly without paying per click. Your assets to get there are already built — 67 blog posts, 22 airline pages, a 4.9 Trustpilot score from 5,230 reviews and an existing USA Today feature. What's missing is the plumbing (sitemap, canonicals, schema) that lets those assets rank, and an editorial link programme aimed at travel press and personal-finance communities (Bogleheads already discusses the brand) rather than at volume.

GROWTH FORECAST

An illustrative scenario — not a modeled forecast

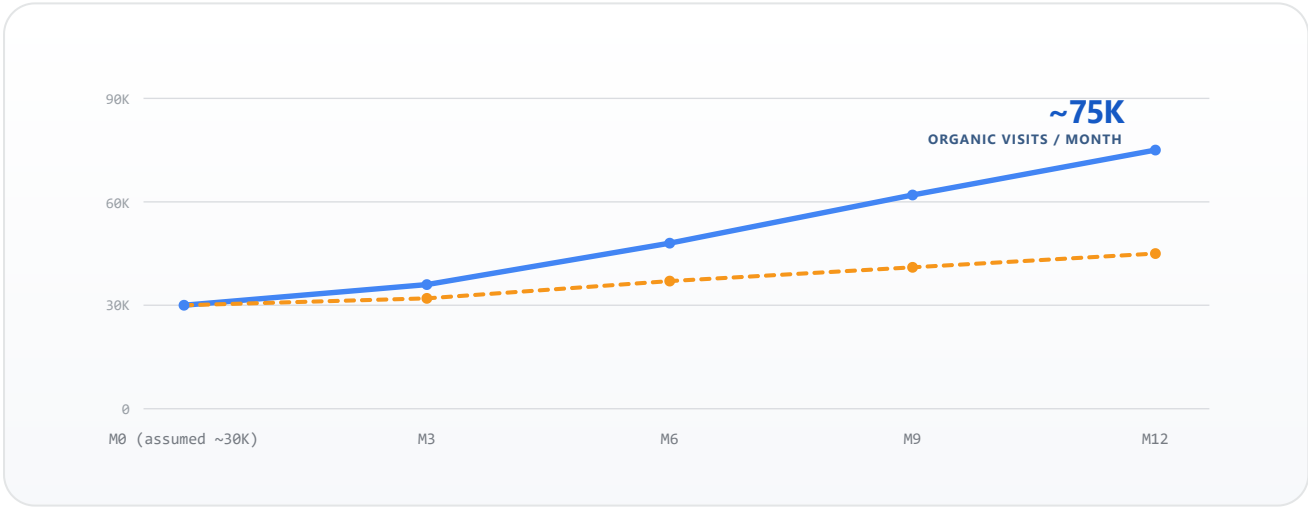

This is directional, not a keyword-by-keyword volume × CTR model, and it carries one explicit assumption: Similarweb's free tier does not disclose the organic share, so we treat the current organic baseline as **roughly 30K visits/month** — consistent with organic sitting below the three disclosed channels of a 183K/month site. Replace that number with the real one from Search Console on day one. The range below assumes the Phase 1–3 fixes ship and real content and link work follows.

12-MONTH SCENARIO · ORGANIC VISITS ONLY · ILLUSTRATIVE

From ~30K to roughly 60–90K organic visits per month

Base case if the sitemap/robots host is fixed in month 1, the 159 duplicate first-class pages and 84 missing canonicals are resolved by month 2, templates are cleaned up by month 3, and the blog and airline pages then get sustained content and editorial-link investment. Fixing the plumbing alone, with no content programme, caps far lower — see the note below the chart.

● BASE CASE

● Base scenario — roadmap executed in full

● Slower case — partial or delayed execution

⦿ This range assumes real, ongoing work beyond this audit's punch list: (1) the sitemap/robots host is corrected and GSC is connected in month 1, (2) the first-class duplicates, missing canonicals and shared titles are resolved by month 2, (3) the 10 MB blog posts, inline CSS and schema gaps are fixed by month 3, and — the load-bearing assumption — (4) the blog and airline pages receive consistent new content and earned editorial links through the year, so the organic channel grows into the position Paid Search holds today. It does not assume any paid link-building, and the baseline itself must be replaced with Search Console data before any of this is treated as a target.

- **Without a content and link programme — plumbing fixes only:** correcting the sitemap host, canonicals and templates will stop the bleeding and should recover whatever Google has been discounting, but on its own that is a one-time step, not a growth curve — plausibly the slower (dashed) line or below. The two organic-led competitors in this niche are both small (8–12K/month) and both shrinking, which says the category does not reward hygiene alone; it rewards owned audience and authority, which is what SkyLux has built.

- The upside is grounded in what the site already has, not an aspirational number: 183K monthly visits proves demand and brand recall exist; 5,230 Trustpilot reviews at 4.9 give it a trust asset most competitors lack; 67 published articles and 22 airline guides are an existing content base waiting on canonicals and schema. The business is not starting organic from zero — it has simply never pointed Google at itself.

BRAND REPUTATION ANALYSIS

Brand reputation

The brand has a genuinely strong review footprint on Trustpilot and a BBB A+ accreditation — and, sitting right next to them in a brand-name search, a cluster of "is it legit?" threads and a BBB consumer score of 2.6. None of this is a scanner artefact; these are real customer experiences on both sides, and the gap between them is itself the reputation issue.

Trustpilot: 4.9 / 5 from 5,230 reviews, 94% five-star

A large, active, claimed profile; the company replies to 76% of negative reviews. Trustpilot's own AI summary praises agent helpfulness and deal-finding, and flags "occasional issues with post-purchase support" and customers "not being fully informed about certain booking procedures." This is the brand's strongest external trust asset and should be surfaced with `Organization` schema and on the pages that currently claim "97% of Travelers Recommend" without a source.

BBB Accredited Business, A+ rating, 7-year-old domain with real legal entities

Travelbusinessclass.com, LLC (323 Sunny Isles Blvd, Sunny Isles Beach, FL) and Travel Management Group LLC (Wilmington, DE) are both listed. The domain has been registered since June 16, 2019 with registrar locks in place, and `llms.txt` names the legal entity and canonical domain. These are the facts that distinguish an established agency from the fly-by-night operators discussed in the same forums.

BBB consumer reviews: 2.6 / 5 from 5 reviews; 11 complaints closed in the last 12 months

The A+ is BBB's assessment of the business's responsiveness; the 2.6 is what customers wrote. Recent complaints (Feb–May 2026) concern a $4,041 ticket cancelled within 24 hours without notice, a Zipair fare sold as "business class" without disclosure of its à-la-carte model, a failed ticketing that left a family overseas without $14K of tickets, and refunds converted to travel credits after airline cancellations. The company answered every complaint, generally citing airline terms. The pattern — **disclosure at point of sale and handling of disruptions** — is operational, not SEO, but it is what a prospect finds on page one of a brand search.

"Is it legit?" threads rank for the brand name

Tripadvisor ("Anyone used travelbusinessclass.com?") carries a 2019-era allegation of a cancelled return flight and a slow partial refund; Bogleheads ("travelbusinessclass.com [is it legit?]") concludes "not usually scams per se, but tread carefully… advertising of extremely low fares is a bit misleading." Reddit threads about similarly named competitors (business-class.com, travel-business.com, airbusinesstravel.com) are also returned for the brand query, so the niche's reputation bleeds onto yours. None of these is a verdict against the company — but the company is absent from all of them.

Third-party complaint aggregation is now indexing the brand

complaintcensus.com has published an automated analysis of 618 Trustpilot reviews (Oct 2025–Oct 2026) under the heading "TravelBusinessClass: most-reported complaints," listing "support unhelpful" (17), "misleading pricing" (9), "unreachable support" (9) and "overcharging" (8) as rising themes. It is a scraper, not a regulator — but it is another page competing for the brand SERP, and it will keep updating.

No automated "scam site" classifications found

Searches for the domain against ScamAdviser and Gridinsoft returned no negative classification pages — a meaningful difference from young domains in this space. The brand's reputation risk is human-written reviews and forum threads, which respond to engagement and operational fixes, not to dispute forms.

THE NEXT STEP

Continue with Crowdo Core

This audit was designed to give you a real sample of how Crowdo works: a full technical and content review, and a first view of your website's current visibility potential. The next step is to build on those findings with the Crowdo Core package that best fits your site's stage, opportunities, and growth needs.

★ RECOMMENDED NEXT STEP

Turn the trial into a growth plan — continue with the [Crowdo Core package] recommended for your website.

At 183K visits a month on a 7-year-old domain with 5,230 reviews, travelbusinessclass.com is not a foundation-stage site — it is an established brand whose organic channel has been under-built while paid carried the load. The right starting point is a technical reset (sitemap host, canonicals, duplicates) followed immediately by authority-building on the content that already exists, with the goal of shifting the channel mix rather than simply adding volume.

What happens after the audit

Package Recommendation

We choose the Crowdo Core package that best matches the current condition and potential of the website.

Structured Growth Plan

The next stage turns the trial findings into a clearer roadmap for visibility, authority, and long-term growth.

Expanded SEO & GEO Support

You move from a small sample into broader support across the core visibility areas that matter most.

Stronger Authority Signals

The next package allows us to build more trust, stronger placements, and a wider off-page presence.

Deeper Website Support

We can go further into technical, structural, and content-related improvements that help the site grow more consistently.

The trial shows where the opportunity starts. **Crowdo Core is the next step** for turning that opportunity into a consistent and scalable growth system.

Continue with Crowdo Core →

Any questions about this audit?

Happy to walk through any finding above in more detail — no obligation.

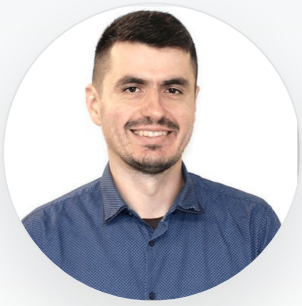

TRAVELBUSINESSCLASS.COM

Let's talk through the findings.

Every number in this report traces back to a live crawl of your sitemap, a header or DNS check against the live site, a public Similarweb estimate, or a public review page — reach out if you'd like the underlying data for any section, including the full 429-row crawl export behind the Technical and On-Page findings.
